Chapter 1

pFUnit 2 - Documentation - Version 0.0 (2014-0123-0142 MLR)

Quick link to the code!

1.1 Overview

pFUnit is a unit testing framework enabling JUnit-like testing of serial and MPI-parallel software written in Fortran. Initial support for OPENMP has been implemented. pFUnit makes use of modern Fortran programming techniques, including object oriented programming, offering a convenient, lightweight mechanism for Fortran developers to create and run software tests that specify the desired behavior for a given piece of code. The framework was originally created by developers from NASA and NGC TASC. The project is hosted at sourceforge/projects/pfunit.

If you are using pFUnit, please leave a note/topic at Applications of pFUnit, or send a note to Tom Clune, Ph.D., Chief, Software Systems Support Office Code 610.3, NASA Goddard Space Flight Center.

Please refer revisions and comments about the documentation to Mike Rilee, Ph.-D., Rilee Systems Technologies.

Chapter 2

Obtaining pFUnit

The best way to obtain pFUnit is to `clone pFUnit from the git repository` from SourceForge as follows.

```
# Read Only Access
git clone git://git.code.sf.net/p/pfunit/code pFUnit
```

This will create the directory pFUnit in the current working directory.

You may also visit the project page at SourceForge and download the source tarfile "pFUnit.tar.gz" there.

`http://sourceforge.net/projects/pfunit/` or `http://sourceforge.-net/projects/pfunit/files/latest/download`

Extracting this tarfile via a command like

'$ tar zxf ./pFUnit.tar.gz'

will place the pFUnit files into the current working directory.

For other ways to acquire the code visit

`https://sourceforge.net/p/pfunit/code/ci/master/tree/`

or contact the pFUnit team.

Chapter 3

Installation

3.1 Installing pFUnit

Comentatry for the page.

3.2 Prerequisites

The development work for pFUnit has mostly been carried out on a mixture of systems, including high-end computers, Apple Mac OSX, and linux-based systems. A preliminary Windows/CYGWIN port has been contributed by a user. Full use of the system depends on the following being available.

- Fortran 2003+ (Tested with Intel 13.1+, NAG 5.3, GCC 4.8.1., IBM's XLF)

- The Message Passing Interface (MPI)

- GNU Make

- Python

`Doxygen` is used to generate documentation.

The system routinely undergoes regression testing with GNU, Intel, and NAG fortran compilers and OpenMPI.

3.3   Obtaining pFUnit

The best way to obtain pFUnit is to `clone pFUnit from the git repository` from SourceForge as follows.

```
# Read Only Access
git clone git://git.code.sf.net/p/pfunit/code pFUnit
```

This will create the directory pFUnit in the current working directory.

You may also visit the project page at SourceForge and download the source tarfile "pFUnit.tar.gz" there.

`http://sourceforge.net/projects/pfunit/` or `http://sourceforge.-net/projects/pfunit/files/latest/download`

Extracting this tarfile via a command like

'$ tar zxf ./pFUnit.tar.gz'

will place the pFUnit files into the current working directory.

For other ways to acquire the code visit

`https://sourceforge.net/p/pfunit/code/ci/master/tree/`

or contact the pFUnit team.

3.4   Manifest - What's in the directory?

In the top level of the pFUnit distribution you will see the following files.

COPYRIGHT - Contains information pertaining to the use and distribution of pFUnit.

Examples - Contains examples of how to use pFUnit once it is installed.

GNUmakefile - The top level makefile for building and installing pFUnit.

LICENSE - The NASA Open Source Agreement for GSC-15,137-1 F-UNIT, also known as pFUnit.

bin - Executables used to construct and perform unit tests.

include - Files to be included into makefiles or source, including use code.

source - Source code and scripts of the pFUnit library and framework.

tests - Source code for unit testing pFUnit itself.

tools - Tools used to help develop, build, and install pFUnit.

3.5 Configuration

Little needs to be done to configure pFUnit for the build, however there are several environment variables on which the package depends.

'F90_VENDOR' - is set to include the correct makefile in /include, i.e. GNU, Intel, NAG, or PGI. Case insensitive file systems may cause some confusion from time-to-time.

'F90' - is set to the Fortran compiler being used: e.g. ifort for Intel, gfortran for GNU.

'COMPILER' - is set according to 'F90_VENDOR' and is automatically set in the top level makefile.

For MPI-based unit testing, your setup may require the following as well.

'MPIF90'

```
$ export MPIF90=mpif90
```

As a convenience for working with multiple MPI configurations, you may also set the following.

'MPIRUN'

```
$ export MPIRUN=/some.path/mpirun
```

'DOXYGEN' - To generate documentation, set DOXYGEN to the desired executable. N-OTE: Doxygen Version 1.8.5 does not respect CamelCase names from Fortran source code by currently converting all to lowercase. It does this to get HTML links correct for references in the source code that also do not respect the CamelCase convention. The Fortran standard specifies case insensitivity. Doxygen 1.7.x seems to better respect CamelCase.

```
$ export DOXYGEN=/opt/local/share/doxygen/doxygen-1.7.6/bin/doxygen
```

3.6 Building pFUnit

3.6.1 Building pFUnit for testing serial codes (Non-MPI)

1. Change to the directory into which pFUnit has been placed. 2. Set the environment variables (in bash):

```
$ export F90=gfortran-mp-4.8
$ export F90_VENDOR=GNU
```

3. To build pFUnit for unit testing of serial codes, execute make. The unit tests for pFUnit itself will run automatically.

```
$ make tests
```

3.1 Occasionally on the first run through, one will get a spurious (runtime) error, for example in the unix process component.

```
Re-execute "make tests" to check again.
```

4. At this point the pFUnit object library is in the source directory, along with a large number of Fortran module files.

3.6.2 Building pFUnit for testing parallel codes (MPI)

To build pFUnit for unit testing MPI-based codes, be sure that the environment is properly set up for the MPI implementation you are using. Depending on your local environment, you may need execute the build within a batch or other job queing system, e.g. an interactive batch job under PBS. The steps for building pFUnit start out the same as for the serial case above, but add MPI=YES to the environment to switch on MPI support. The MPI-based unit tests for pFUnit itself will run automatically. Again, occasionally a spurious (runtime) error may appear on the first execution.

3. Execute make as follows.

```
$ make tests MPI=YES
```

4. At this point an MPI-enabled pFUnit object library is in the source directory, along with a large number of Fortran module files.

Also, one may get some harmless "no symbols" warnings when the pFUnit library is constructed.

3.6.3 OPENMP

Initial (limited) support for OPENMP has been implemented. At this writing, a basic functionality is available.

The process for building pFUnit for testing OPENMP-based codes is similar to that for other paradigms.

3. To compile for OPENMP support execute make as follows.

```
$ make tests OPENMP=YES
```

4. At this point the OPENMP-enabled pFUnit is ready to be installed.

3.6.4   Cleaning

To clean the pFUnit build directory for the space or to rebuild there are two options.

1. Make clean to remove object files and other intermediate products.

```
$ make clean
```

2. Make distclean to remove libraries and other more final products.

```
$ make distclean
```

3. Some directories support a 'make src_clean' to remove intermediate products in subdirectories.

3.6.5   Documentation

A start at documentation for pFUnit is in the documentation directory. `Doxygen` is our primary documentation tool. To make the documentation, which will be generated in the documentation directory, please invoke the following.

```
$ make documentation
```

Or to make a reference manual.

```
$ make documentation/pFUnit2-ReferenceManual.pdf
```

To select a specific version of Doxygen, please set the DOXYGEN environment variable as in Configuration. You may wish to do this if your code uses CamelCase names as current versions of Doxygen (1.8.5) do not respect this convention for Fortran.

3.6.6   CMAKE

Initial support for CMAKE has been implemented. At this writing, a basic functionality is available.

3. The process for building pFUnit using cmake is as follows. In the top directory of the distribution make a new directory to support the build, then change to that directory and run cmake (pointing back to the source) to generate the required makefiles.

```
$ mkdir build
$ cd build
$ # e.g. cmake -DMPI=YES -DOPENMP=NO -DINSTALL_PATH=<A path> <path to source>
$ cmake -DMPI=NO ..
$ make tests
```

One may also set the environment variable PFUNIT instead of setting INSTALL_PATH on the cmake command line as given above.

4. If the build is successful, then at this point make install should work.

3.7 Installation

3.7.1 Installation - Serial

To install pFUnit for regular use, set INSTALL_DIR to the location in which to place pF-Unit. This can be done on the make command line. For example, after compiling pFUnit for serial use (MPI absent or MPI=NO), please try.

```
$ # In the top of the pFUnit build directory.
$ make install INSTALL_DIR=/opt/pfunit/pfunit-serial
```

Note: you may need special priveleges to install in some locations, e.g. via sudo.

To test the installation set PFUNIT to INSTALL_DIR, then change the working directory to Examples in pFUnit distribution and execute "buildIt," which will run a number of examples. These include some expected failures.

```
$ # In the top pFUnit build directory...
$ export PFUNIT=/opt/pfunit/pfunit-serial
$ pushd Examples
$ ./buildIt
```

3.7.2 Installation - MPI

For installing an MPI-enabled pFUnit library, change to the top of the distribution and execute make with MPI=YES. You may need to "make distclean" first. After compilation and pFUnit passes its self-tests, then installation proceeds as for the serial case above.

```
$ make install INSTALL_DIR=/opt/pfunit/pfunit-parallel
```

To test, set PFUNIT and go into Examples/MPI_Halo directory.

```
$ # In the top pFUnit build directory...
$ export PFUNIT=/opt/pfunit/pfunit-parallel
$ # The variable MPIF90 must be set to the appropriate build script.
$ export MPIF90=mpif90
$ cd Examples/MPI_Halo
$ make
```

This will compile and run a set of parallel examples that includes intentional failures.

3.7.3 Installation - OPENMP

At this time the OPENMP version of pFUnit can be installed in the same way as for the serial or MPI-parallel codes. OPENMP support, tests, and examples are limited as of this writing.

3.7.4 Installation - DEFAULT DIRECTORY

If INSTALL_DIR is not set, "make install" will attempt to install pFUnit into the top build directory. This will create directories such as lib and mod in the top level of the build directory and will overwrite the include/base.mk with include/base-install.mk. If this is not desired, then "make develop" will put back the original base.mk, which is the file to be used for development and building pFUnit. In general, we recommend installing to a directory that is not also the build directory.

Chapter 4

Usage

- Usage - Configuration

- Usage - Hello World

- Usage - Preprocessor

4.1   Usage

4.1.1   Usage - Configuration

For regular use, after installation, the same compiler/MPI development configuration that was used to build pFUnit should be used. Once the environment variables and paths associated with the environment are set, to configure pFUnit, please set the following.

'PFUNIT' - set to the directory into which pFUnit was installed.

'F90_VENDOR' - set to Intel, GNU, NAG, or PGI accordingly.

4.1.2   Usage - Hello World

For an example of a simple usage of pFUnit, see Examples/Simple/tests.

The simplest way to write a test is to write a preprocessor input file (extension ".pf"), which is a Fortran free format file with preprocessor directives added. An example from "helloWorld.pf" follows.

```
! from helloWorld.pf
@test
subroutine testHelloWorld()
   use pfunit_mod
```

```
   implicit none
   @assertEqual("Hello World!","Hello World!")
end subroutine testHelloWorld
```

One then instructs the preprocessor to construct a suite to execute these tests via the "testSuites.inc" file as follows.

```
! from testSuites.inc
ADD_TEST_SUITE(helloWorld_suite)
```

At this point, one can invoke the preprocessor to generate a Fortran file that when compiled and linked with pFUnit will execute the tests. For more information please see The Preprocessor - pFUnitParser or try out the examples in Example/Simple.

4.1.3 Usage - Preprocessor

Please see The Preprocessor - pFUnitParser.

Chapter 5

Development

Generally pFUnit development is performed in the build directory structure. Care should be taken to make clean or distclean in between configuration changes. As stated in - Installation, it is best to set INSTALL_DIR and "make install" pFUnit to another directory that can be placed in a user's paths.

Chapter 6

Feedback & Support

- [Feedback](#)

- [Support](#)

6.1   Feedback

Feedback is welcome, please use the facilities at `sourceforge/projects/pfunit` to share your views.

Open a `ticket` for bugs, features, and patch recommendations.

If you use pFUnit, please let us know by leaving a note in our `Applications of pFUnit` forum, or email `Tom Clune`, Ph.D., NASA Goddard Space Flight Center. - Letting us know about your application helps us seek support for pFUnit's continued development and improvement.

6.2   Support

Please open a `ticket` for bugs, features, and patch recommendations. For longer term needs or considerations, please visit our `discussion forums` or contact `- Tom Clune`, Ph.D., NASA Goddard Space Flight Center.

You may also find some help at FAQ and Tips.

pFUnit supports the software development of several weather and climate simulations efforts. We constantly seek to improve and correct pFUnit for our users' benefit, granting priority to the needs of our major users. Please share with us information about your application on our `Applications of pFUnit` forum.

Chapter 7

FAQ and Tips

7.1   FAQ

7.1.1   Zero Tests Run

Symptom: The system under test compiles and runs fine, but reports zero tests run.

Solutions:

- There is no `testSuites.inc` file. Please add a `testSuites.inc` that lists the suites to add via `ADD_TEST_SUITE(`*the_suite_to_add*`)`, one to a line.

- There is no `-DUSE_MPI` passed to the compiler during the build. Please add to the compiler invokation. Please see Some Tests Are Not Running.

7.1.2   Some Tests Are Not Running

Symptom: The system under test compiles and runs fine, but reports that some tests don't run.

Solutions:

- There is no −DUSE_MPI passed to the compiler during the build. Please add as in the following example.

```
% $PFUNIT/bin/pFUnitParser.py test_pio.pf test_pio.F90
% mpif90 -DUSE_MPI $PFUNIT/include/driver.F90 \
%       -I$PFUNIT/mod -L$PFUNIT/lib -lpfunit test_pio.F90

% mpirun -np 8 ./a.out

.
Time:          0.004 seconds

 OK
```

7.2 Tips

7.2.1 Environment Modules

Though not strictly required, the Environment Modules package can be a convenient way to package, maintain, and switch between environments. This can be particularly important for pFUnit, which must be built using the same tool suite being used for development, e.g. compilers, linkers, etc. [To do: A sample pFUnit modulefile is provided in the OTHER directory.]

7.2.2 Compile Time Errors

Compile time errors like '"include [...]include/.mk" not found' likely signify that you are not executing make in the top level directory during a build. Alternatively, during regular usage after installation, PFUNIT has not been set.

During building, if you wish to compile in a subdirectory within the pFUnit heriarchy, please try setting the COMPILER environment variable on the make command line. For example:

```
$ make all COMPILER=Intel
```

7.2.3 Intermediate files used by pFUnit

If you wish to see the intermediate files, use the target .PRECIOUS in the makefile to keep them from being deleted. For example:

```
# In GNUmakefile
.PRECIOUS: %_cpp.F90
```

Chapter 8

Platform Specific Notes

8.1   Mac OSX

The MacPorts package management system is a convenient way to install and maintain many packages, including gcc which includes gfortran.

8.2   Windows/CYGWIN

User contributed code for Windows/CYGWIN has been added, but is currently not tested and supported by the pFUnit team. At this writing, 2013-1031, serial Examples and MPI are not known to be supported. Please contact us if you wish to either contribute or otherwise discuss this port.

Chapter 9

Acknowledgments

Chapter 10

Known Installations & Versions

master - The cutting edge of pFUnit development.

pfunit_2.1.0 - A feature freeze prior to a major upgrade of the preprocessor.

Chapter 11

TODO

- Make other directory.

- Make Environment Modules example in other directory.

- Other build systems, e.g. CMake.

Chapter 12

The Preprocessor - pFUnitParser

Overview of Preprocessor (pFUnitParser.py)

//

12.1   Using The Preprocessor

How to write tests using the ".pf" files. We expect this to be the main way people write pFUnit-based tests. Please see the Examples directory for a wide range of examples. The .pf files themselves are generally to be found in an example's "tests" subdirectory.

12.1.1   Configuration - testSuites.inc

The include file "testSuites.inc" tells the preprocessor to generate code for TestSuites listed therein. The suite names are based on the TestCases provided in the preprocessor input file or the name of the preprocessor input file (.pf) itself. For example, if no

module is defined in a .pf file, i.e. the preprocessor will define the module, one can set up a "testSuites.inc" as follows.

```
! To load "exampleTestsNoModule.pf".
ADD_TEST_SUITE(exampleTestsNoModule_suite)
```

For a .pf file that contains a module associated with a test suite the syntax is as follows.

```
! To load "exampleTests.pf" implementing the module exampleTests_mod.
ADD_TEST_SUITE(exampleTests_mod_suite)
```

12.1.2   Invocation

To run the preprocessor on on a preprocessor input file "exampleTests.pf", invoke:

```
$ ${PFUNIT}/bin/pFUnitParser.py exampleTests.pf exampleTests.F90
```

A convenient GNUmakefile rule is as follows.

```
%.F90: %.pf
        $(PFUNIT)/bin/pFUnitParser.py $<  $@
```

12.1.3   Preprocessor Input File (.pf)

The preprocessor input file is a Fortran free format file that contains subroutines, including those implementing the suite of tests, or a module with the tests, TestCases, and support for parameters. The preprocessor reads and parses this file producing a fortran file implementing the tests, automating some boilerplate code. Embedded "@" directives inform the preprocessor about information needed to generate the test suite. If the .pf file does not implement a module providing a test suite, the preprocessor will use the name of .pf file referred to by "testSuites.inc". Currently only one test suite per .pf file is allowed, a limitation of the current implementation of the parser.

Many example .pf files may be found in the examples' "tests" subdirectories in the - Examples directory.

Below we present the most commonly used directives first, but in a .pf file using all of these capabilities, the most common order is as follows.

- @Parameters

- @TestCase

- @Test or @MPITest

    - @Assert

12.1.4 Directives

Preprocessor "@" directives, which in keeping with Fortran style are not case sensitive, instruct the preprocessor how to interpret parts of the code relevant to the generation of the test suite. The most important directives follow.

12.1.4.1 @Test

This directive is used to indicate a test routine to the preprocessor, which then includes it in the test suite. There may be multiple tests in the .pf file, each annotated by the directive. For example, from Examples/Fixture:

```
@Test
   subroutine testBracketInterior(this)
      class (Test_LinearInterpolator), intent(inout) :: this
      @assertEqual([3,4], this%interpolator%getBracket(at=4.))
   end subroutine testBracketInterior

@Test
   subroutine testInterpolateAtNode(this)
      class (Test_LinearInterpolator), intent(inout) :: this
      @assertEqual(2., this%interpolator%interpolate(at=3.))
   end subroutine testInterpolateAtNode
```

12.1.4.2 @MPITest

This directive indicates an MPI parallel test to the preprocessor, which then includes it in an MPI enabled test suite. The directive takes a single argument, the requested number of MPI processes to run. The syntax, exemplified by one of the tests from Examples/MPI_Halo:

```
@mpiTest( npes=[1,2,3])
subroutine testHaloInterior(this)
   use Halo_mod
   use pfunit_mod
   implicit none
   class (MpiTestMethod) :: this

   integer, parameter :: N = 2
   real :: a(N,0:N+1)
   integer :: p

   p = this%getProcessRank()
   a(:,1:N) = p
   a(:,0) = -1
   a(:,N+1) = -1

   call haloFill(a, this%getMpiCommunicator())

   @assertEqual(real(p), a(1,1))
```

```
    @assertEqual(real(p), a(2,1))
    @assertEqual(real(p), a(1,2))
    @assertEqual(real(p), a(2,2))

end subroutine testHaloInterior
```

12.1.4.3   @Assert

The directives are expanded into calls to similarly named pFUnit library routines. The syntax for the directives follows the pattern for below.

```
@assertEqual(expected,found,'An identifying or explanatory message.')
```

The preprocessor will automatically add information about source location (file & line number) to the call emitted to the test suite code. It also adds the check for exceptions.

For more information about directives, please refer to the following.

- @assertEqual
- @assertTrue
- @assertFalse
- @assertLessThan
- @assertLessThanOrEqual
- @assertGreaterThan
- @assertGreaterThanOrEqual
- @assertIsMemberOf
- @assertContains
- @assertAny
- @assertAll
- @assertNotAll
- @assertNone
- @assertIsPermutationOf
- @assertExceptionRaised
- @assertSameShape
- @assertIsNaN
- @assertIsFinite

12.1.4.4 @Parameters

The directive indicates the declaration of the parameterized type used to generate the iteration over the multiple parameter values. It also identifies the names of the parameters to be iterated over. The preprocessor extracts type information from the declaration of the parameter type collection that immediately follows the directive. This directive will set up the iteration. To define the parameter values per iteration the `getParameters` method of the abstract ParameterizedTest must be implemented. For example:

```
@Parameters = [p1,p2]
type, extends(AbstractTestParameter) :: exampleCase
    integer :: i
    real :: x
end type exampleCase
```

12.1.4.5 @TestCase

This directive identifies to the preprocessor the TestCase declaration. The type declared at this point extends TestCase (or its extension), which includes setting methods such as the following: setUp, tearDown, runMethod, userMethod. For the extension MPITestCase, as with ParameterizedTestCase, you have the option (requirement if parameters are used) to set getParameters and getParameterString. For example:

```
@TestCase
type, extends(MPITestCase) :: Test_Parameters
    integer :: p1, p2
    procedure(runMethod), pointer :: userMethod => null()
 contains
    procedure, nopass :: getParameters
    procedure :: getParameterString => getParameterString_
    procedure :: runMethod
end type Test_Parameters
```

Chapter 13

@Assert Preprocessor Directives

- @assertEqual
- @assertTrue
- @assertFalse
- @assertLessThan
- @assertLessThanOrEqual
- @assertGreaterThan
- @assertGreaterThanOrEqual
- @assertIsMemberOf
- @assertContains
- @assertAny
- @assertAll
- @assertNotAll
- @assertNone
- @assertIsPermutationOf
- @assertExceptionRaised
- @assertSameShape
- @assertIsNaN
- @assertIsFinite

13.1 @Assert Preprocessor Directives

13.1.1 @assertEqual

13.1.2 @assertTrue

13.1.3 @assertFalse

13.1.4 @assertLessThan

13.1.5 @assertLessThanOrEqual

13.1.6 @assertGreaterThan

13.1.7 @assertGreaterThanOrEqual

13.1.8 @assertIsMemberOf

13.1.9 @assertContains

13.1.10 @assertAny

13.1.11 @assertAll

13.1.12 @assertNotAll

13.1.13 @assertNone

13.1.14 @assertIsPermutationOf

13.1.15 @assertExceptionRaised

13.1.16 @assertSameShape

13.1.17 @assertIsNaN

13.1.18 @assertIsFinite

17.5 Assert_mod Module Reference

$<$BriefDescription$>$

17.5.1 Detailed Description

$<$BriefDescription$>$

Author

Tom Clune, NASA/GSFC

Date

07 Nov 2013

Note

$<$A note here.$>$ $<$Or starting here...$>$

The documentation for this module was generated from the following file:

- Assert.F90

17.6 AssertBasic_mod Module Reference

$<$BriefDescription$>$

Data Types

- interface **assertEqual**
- interface **assertExceptionRaised**
- interface **assertFalse**
- interface **assertIsFinite**
- interface **assertIsNaN**
- interface **assertTrue**
- interface **fail**
- type **UnusableArgument**

Public Member Functions

- subroutine **assertExceptionRaisedMessage** (message)
- subroutine, public **assertSameShape** (shapeA, shapeB, message, location)
- logical function, public **conformable** (shapeA, shapeB)
- logical function, public **nonConformable** (shapeA, shapeB)
- subroutine, public **assertAny** (conditions, message, location)
- subroutine, public **assertAll** (conditions, message, location)
- subroutine, public **assertNone** (conditions, message, location)
- subroutine, public **assertNotAll** (conditions, message, location)
- subroutine **assertIsNaN_double** (x, message, location)
- subroutine **assertIsFinite_single** (x, message, location)
- subroutine **assertIsFinite_double** (x, message, location)

17.19 BaseTestRunner␣mod Module Reference

$<$BriefDescription$>$

Data Types

- type **BaseTestRunner**
- interface **run**

17.19.1 Detailed Description

$<$BriefDescription$>$

Author

Tom Clune, NASA/GSFC

Date

07 Nov 2013

Note

$<$A note here.$>$ $<$Or starting here...$>$

The documentation for this module was generated from the following file:

- BaseTestRunner.F90

17.20   BeforeAfter_mod Module Reference

Public Member Functions

- subroutine **first** (this)
- subroutine **last** (this)
- subroutine **succeeds** (this)
- subroutine **fails** (this)

Public Attributes

- integer **countStart** = 0
- integer **countComplete** = 0

The documentation for this module was generated from the following file:

- beforeAfter.pf

17.21   BrokenSetUpCase_mod Module Reference

Data Types

- type **BrokenSetUpCase**

Public Member Functions

- type(BrokenSetUpCase) function, pointer, public **newBrokenSetUpCase** ()

The documentation for this module was generated from the following file:

- BrokenSetUpCase.F90

17.22   BrokenTestCase_mod Module Reference

Data Types

- type **BrokenTestCase**

Public Member Functions

- subroutine **tearDown** (this)

The documentation for this module was generated from the following file:

- BrokenTestCase.F90

17.23 GenerateRealArrayNewSignature::constraintASSERTEQUA-L Class Reference

Inheritance diagram for GenerateRealArrayNewSignature::constraintASSERTEQUAL:
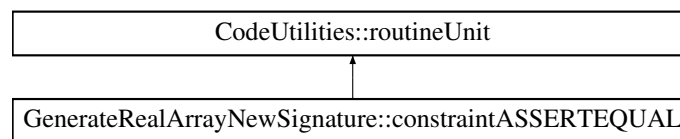

Public Member Functions

- def __init__

  This next line actually generates the text of the code.

Public Attributes

- **expectedDescr**
- **foundDescr**
- **name**
- name1

  Add in the extra module procedures...

- tolerance

  If you need another kind of code generator, perhaps conditioned on eDesc., fDesc., or tol, then that logic would go here...

17.23.1 Constructor & Destructor Documentation

17.23.1.1 def GenerateRealArrayNewSignature::constraintASSERTE-QUAL::__init__ (*self, expectedDescr, foundDescr, tolerance* **)**

This next line actually generates the text of the code.

17.23.2 Member Data Documentation

17.23.2.1 GenerateRealArrayNewSignature::constraintASSERTEQUAL::name1

Add in the extra module procedures...

If needed... Kluge. Need to make makeSubroutineNames and load the extra interface entries there.

17.23.2.2 GenerateRealArrayNewSignature::constraintASSERTEQUAL::tolerance

If you need another kind of code generator, perhaps conditioned on eDesc., fDesc., or tol, then that logic would go here...

E.g. to implement assertEqual(Logical(...))

The documentation for this class was generated from the following file:

- GenerateRealArrayNewSignature.py

17.24 mods::pre::pre2::dataString Class Reference

Public Member Functions

- def **__init__**
- def **insert**

Check that test procedure with no parens is accepted.
```

17.113.1.5 def testParser::TestParseLine::testAtTestSkipComment (*self*)

```
Ignore comment lines between @test and subroutine foo().
```

17.113.1.6 def testParser::TestParseLine::testMatchAtAfter (*self*)

```
Check that a line starting with '@after*' ...
```

17.113.1.7 def testParser::TestParseLine::testMatchAtAssertEqual (*self*)

```
Check that a line starting with '@assertEqual' is detected
as an annotation.
```

17.113.1.8 def testParser::TestParseLine::testMatchAtAssertOther (*self*)

```
Check that a line starting with '@assert*' is detected
as an annotation.
```

17.113.1.9 def testParser::TestParseLine::testMatchAtBefore (*self*)

```
Check that a line starting with '@before*' ...
```

17.113.1.10 def testParser::TestParseLine::testMatchAtMpiAssert (*self*)

```
Check that a line starting with '@mpiAssert*' is detected
as an annotation.
```

17.113.1.11 def testParser::TestParseLine::testMatchAtSuite (*self*)

```
Check that a line starting with '@suite changes the suite name ...
```

17.113.1.12 def testParser::TestParseLine::testMatchAtTestCase (*self*)

```
Check that a line starting with '@testcase' is detected as an
annotation.
```

17.115 TestResult_mod Module Reference

<BriefDescription> Note: A possible extension point for user-specialized TestResults.

Data Types

- type **TestResult**

Public Member Functions

- type(TestResult) function, pointer, public **newTestResult** ()
- subroutine **addError** (this, aTest, exceptions)
- integer function **failureCount** (this)
- subroutine **addListener** (this, listener)

17.115.1 Detailed Description

<BriefDescription> Note: A possible extension point for user-specialized TestResults.
